**Module Objective**

The design of healthy and sustainably buildings not only requires knowledge of the materials and technology needed for building to be – in themselves – sustainable, but necessitates also some insight into the interactions between humans and their built environments. The module 'Environmental psychology' serves these objectives in various ways: by teaching psychology with a focus on human-environment interaction, as well as providing the foundations in sustainable development. As students will join us with mostly engineering degrees, they will also be introduced to the foundations of psychology to enable them to understand these human-environment interactions.

Environmental psychology itself consists of two strands: the impacts of human behaviour on the environment, and resulting efforts to encourage pro-environmental behaviour, and reversely, environmental influences on human behaviour. Both of these, as well as foundations in sustainable development, are important issues to consider in the design of healthy and sustainable built environments.

**Professional and methodological competence**

Students are able to identify environmental influences on human wellbeing, and pro-environmental human behaviour. They will be able to understand, evaluate and apply (environmental) psychological theories and models, and the influences various environmental factors may have on human well-being.
Students know standards (Global Reporting Initiative) of sustainability management, their structure and function. They are able to apply single material topics and to compare the results with the reporting of other companies.

**Personal competence**
Students can understand psychological theories and models, evaluate their significance for, and apply them in, their field of work. They are able to see the built environment as a part of the bigger social and cultural system.

Students can understand the significance of different sustainable development topics. Furthermore, they are able to evaluate these topics.

**Social competence**
Social competence of students is promoted by the appropriate use of cooperative methods such as group work and moderated discussion.

**Applicability in this and other Programs**

Masters-Thesis

**Entrance Requirements**

None

**Learning Content**

- Introduction to psychology, scope of environmental psychology
- Introduction to social and health psychology, with a focus on behaviour change theories and models
- Environmental Psychology and its research methods
- Environmental Stress and Health Benefits of Nature
- Environment and Quality of Life: Urban Environments and working environments
- Introduction to sustainable development
- The reporting of sustainable development: GRI reporting (human rights; labour rights; environmental topics; etc.)

**Teaching Methods**

Seminaristic teaching combining lectures, exercises, group work, (group) presentations, classroom discussions, as well as one field trip.
Recommended Literature

**Module Objective**

Students learn about challenges and complexities of sustainability on international, national and regional level. They learn the historical development of sustainability, its current state and possible future scenarios and are able to transfer this knowledge to the specific situation of their country of origin. Furthermore, they understand the role of the construction sector in the quest for sustainability.

Based on a case study, the students understand the concept of sustainable buildings from start to end.

Based on the 25 principles of building biology, the students are able to evaluate examples of vernacular and modern architecture of their country of origin and learn from their peers from different regions of the world. The students understand the connection between sustainable buildings and sustainable neighbourhoods.

Furthermore, students are able to evaluate building materials and substances, used in construction and operation & maintenance of buildings, with a comprehensive set of criteria for sustainability.
Professional competence

Knowledge

After successfully finishing the module, students will get to:

- Understand the quest for sustainability in its international, national and regional context
- Understand the complexity of sustainability, including its economic, social, cultural and ecological perspectives
- Understand vernacular architecture and its concepts in the context of different climate zones
- Know and understand the 25 principles of building biology and their context
- Understand the context of building and neighbourhood with focus on sustainability
- Understand aspects of sustainability in building materials and substances used in operation & maintenance for their sustainability
- Know and understand Environmental Product Declarations EPDs
- Understand the approach of a sustainable building project

Skills

Upon completion of the module the students will be able to:

- Describe basic concepts of sustainability and its relevance on international, national and regional level and use technical terms adequately
- Describe the ecological footprint and analyse its impact, considering different perspectives
- Describe and exemplify the cradle-to-cradle approach
- Analyse Environmental Product Declarations
- Describe concepts of vernacular architecture in different climate zones
- Transfer adequate concepts of vernacular architecture to contemporary architecture
- Describe building biology principles
- Use building biology principles on a conceptual level to analyse and evaluate vernacular and contemporary architecture in different climate zones
- Evaluate building materials concerning sustainability
- Evaluate substances used in operation & maintenance for their sustainability
o Set up a concept for the development of a sustainable building project (new building)

o Set up a concept for the development of a sustainable retrofit building project

**Social competence**

Students are demonstrating working individually or in small groups to solve problems that aims at enhancing their team-working skills as well as their problem-solving capabilities. Further, Students also know how to work with different groups of stakeholders, understand their perspectives, learn to consider these perspectives in their line of argumentation and act accordingly.

**Methodological competence**

The students improve the knowledge in the field of sustainable buildings based on real case studies. The students should be enabled to apply the acquired knowledge and to critically evaluate and inter-present subject-specific information on the basis of criteria of sustainability and specific building biology criteria. Students develop an analytical system-oriented way of thinking and are able to structure the approach for a sustainable building project.

**Applicability in this and other Programs**

o HSB-03 Smart Buildings

o HSB-07 Evidence-based Design 1

o HSB-11 Standards and Legal framework

o HSB-13 Evidence-based Design 2

o HSB-14 Refurbishment, Renovation

o HSB-16 R&D Project

o HSB-17 Master’s Thesis

**Entrance Requirements**

None
Learning Content

- Basics of sustainability: historical development, current situation and future projection
- Ecological footprint
- Analysis of vernacular architecture in different climate zones
- Different stakeholder - different perspectives: how to deal with it
- Evaluation of sustainability of building materials and substances, with focus on sustainable materials
- Environmental Product Declaration (EPD)
- Circular economy: Cradle-to-cradle approach in the construction sector
- 25 Principles of Building Biology
- Building and neighbourhood – synergies in sustainability
- Sustainable and healthy buildings and neighbourhoods: a structured approach

Teaching Methods

Seminaristic teaching / Exercises / moderated discussion / tutorials / homework / Case studies / presentation by students

Remarks

Excursion to building material manufacturer

Recommended Literature

**Module Objective**

Students learn the basics of building physics and building climatology within an international perspective, including different climate zones and different building cultures and traditions. The approach includes macro- and micro-climate analysis, heat/cold, acoustics, artificial lighting/daylighting/shading, natural ventilation, moisture and noise protection (fire protection is part of HSB-13 Building Safety and Security).

Students learn basic concepts of smart buildings for different building types.

**Professional competence**

*Knowledge*

After successfully finishing the module, students will get to:

- Understand the basic concepts of building physics and building climatology
- Know different climate zones and its corresponding sustainable building concepts
- Understand the basics of building energy balance and relevant criteria of different building materials and systems
Know and understand different aspects of Indoor Environmental Quality and its impact on health and comfort

Know significant threshold values concerning Indoor Environmental Quality

Skills

Upon completion of the module the students will be able to:

- Analyse local climate and propose correct sustainable building concepts
- Calculate simple building energy balances
- Correctly name significant threshold values concerning Indoor Environmental Quality
- Evaluate building envelope materials concerning effects on building energy balance and indoor comfort
- Preselect building materials for Building Simulation Performance software
- Develop a consistent concept for different smart building types

Social competence

Students are demonstrating working individually or in small groups to solve problems that aims at enhancing their team-working skills as well as their problem-solving capabilities. Furthermore, students also know how to work with different groups of stakeholders, understand their perspectives, learn to consider these perspectives in their line of argumentation and act accordingly.

Methodological competence

The students improve their knowledge in the field of building physics and building climatology and are able to deduce from climate analysis correct concepts for climate adapted building designs. With the newly acquired knowledge they are able to pre-select materials and systems for the building envelope, taking into consideration the effects on the building energy balance and the indoor comfort.

The students are able to develop a consistent concept for different types of smart building.
Applicability in this and other Programs

- HSB-07 Evidence-based Design 1
- HSB-11 Standards and Legal framework
- HSB-13 Evidence-based Design 2
- HSB-14 Refurbishment, Renovation
- HSB-16 R&D Project
- HSB-17 Master’s Thesis

Entrance Requirements

None

Learning Content

**Building physics / Building Climatology**

- Definition and scope of Building physics/building climatology
- Introduction into the development of energy efficiency, building performance simulation programs and Green Building Certification systems nationally and internationally
- Analysis of Marco- and micro-climate
- Climate, comfort and strategies of planning sustainable buildings
- Indoor Environmental Quality
- Energy balance of buildings
- Glazing
- Sun chart & planning of shading devices
- Artificial lighting / Daylighting
- Natural ventilation

**Smart Buildings**

- Historical development of Smart Buildings
- Planning concepts for different Smart Buildings types
Teaching Methods
Seminaristic teaching / Exercises / tutorials / homework / Case studies

Remarks
Excursion to companies and/or landmark projects

Recommended Literature
**Module Objective**

Acquiring a comprehensive understanding of fundamental mathematical and statistical concepts; being able to apply mathematical and statistical methods to complex problems. Acquiring a good understanding of qualitative methods and how and when to use them.

The following skills are acquired in this course:

**Professional competence**

In Quantitative Research:

Students are familiar with the scientific research process and have basic knowledge of the quantitative research approach (e.g. main study designs, sampling, data management). They conceive issues of descriptive statistics within the context of the quantitative research approach. They know and calculate descriptive parameters like measures of central tendency and dispersion. They have basic knowledge of the statistical software R and present statistical results according to scientific standards.
In Qualitative Research:

In relation to qualitative methods students will gain knowledge of different qualitative research designs, as well as methods of qualitative data collection and analysis. Students will further understand ethical requirements in research with human participants.

Social competence

Students train their ability for abstract thinking by working with statistical concepts, as well as different epistemological and ontological perspectives in research. They increase their ability of self-organisation by going further into the topic and solving exercises in private study.

Applicability in this and other Programs

no applicability

Entrance Requirements

Basic computer literacy

Learning Content

In Quantitative Research:

- Quantitative research approach: research question, study design, data collection, data management
- Summary statistics: mean, mode, median, range, interquartile range, standard deviation
- Presentation of results: pie charts, bar plots, histograms, box plots, tables
- R software: installation, getting help, basic objects, data import, scripts, commands for parameter calculation

In Qualitative Research:

- Introduction to qualitative research and its distinction from quantitative designs
- Designing qualitative research, including issues of different perspectives; choosing the research topic and designing the research question; the limitations and advantages of qualitative designs
- Methods of qualitative data collection 1: Textual and online data collection
- Methods of qualitative data collection 2: Interactive data collection: interviews and focus groups
o Methods of data analysis 1: Getting started with data – transcription; coding; based on Reflexive Thematic Analysis

o Methods of data analysis 2: Finalising qualitative data analysis

o Methods of data analysis 3: Grounded Theory

o Ethical issues in research with human participants; Evaluating qualitative methodologies and methods

**Teaching Methods**

Lecture, exercises, group work

**Recommended Literature**

**Statistics:**

**Qualitative Methods:**

Module Objective

Students learn about challenges and complexities of environmental hygiene and medicine in buildings. They learn the historical development of hygiene and environmental medicine. Furthermore, they learn about Principles of Human Toxicology and Ecotoxicology, toxicity, Chemistry of the Atmosphere, Building Related Disorders, Allergies and Asthma, Indoor Environment, Indoor air quality and potential pollutants, Sources of pollutants, Human Toxicity and Ecotoxicity of Construction Materials, intake of Selected Contaminants, Emissions from building products, Testing and Evaluation, Regulations, Building Certification systems, Workplace Safety vs. Indoor Environment Quality and labelling schemes.

The students are able to evaluate accordingly building materials and substances, used in construction and operation & maintenance of buildings. They are able to consider aspects of Environmental hygiene and Medicine in the development of the consulting and/or planning projects.
**Professional competence**

**Knowledge**

After successfully finishing the module, students will get to:

- know the different aspects of environmental hygiene and medicine
- Understand its possible impacts on the development of building projects
- Know different approaches to guarantee minimum standards, including economic, financial and socio-cultural aspects

**Skills**

Upon completion of the module the students will be able to:

- Analyse existing problems, and potential future challenges and threats concerning environmental hygiene and medicine in existing buildings
- Analyse potential challenges and threats concerning environmental hygiene and medicine in building projects
- Determine where experts in the field of environmental hygiene and medicine have to be integrated into the design team
- Obtain pro-actively relevant norms and guidelines in different project countries
- Develop adequate solutions in specific building projects
- Communicate adequately with experts in the field of environmental hygiene and medicine
- Address adequately related credits in green building certification systems and healthy building certification systems

**Social competence**

Students are demonstrating working individually or in small groups to solve problems that aims at enhancing their team-working skills as well as their problem-solving capabilities. Further, these groups are lined-up in a way to be mixed multi-cultural in order to foster and fine-tune students’ intercultural interaction capabilities.

**Methodological competence**

The students improve the knowledge in the field of Environmental hygiene and medicine. The students should be enabled to apply the acquired knowledge and to critically evaluate and inter-present subject-specific information on the basis of criteria of environmental hygiene and medicine. Students develop an analytical system-oriented way of thinking and are able to structure the approach for healthy building projects.

## Module Objective

Students learn the concepts of environmental Analytical Methods in building related areas, with focus on monitoring and analysis of physical, chemical and biological factors.

### Professional competence

**Knowledge**

Students are able to explain and reproduce basic theories, principles, and methods related to:

- Fundamentals of measuring physical quantities
- Measuring methods, devices and instruments
- Analysis and processing of measurement results
- Buildings and indoor environments, and associated physical, chemical and biological factors and quantities
- Continuous monitoring and sampling of environmental parameters
Analytical methods of physical and chemical analysis
Analytical methods of biological analysis
Main exposure limits to harmful factors in living areas and workplaces

Skills
Students are capable of:

- Measurement and analysis of various physical signals and quantities
- Employing basic measurement instruments
- Evaluating problems of metrology and to apply methods for describing and processing of measurements
- Selecting and applying the appropriate measurement and analysis method
- Evaluating the measurement results and of related errors and uncertainties
- Employing software tools for measurement, data analysis and processing
- Applying theoretical concepts to practical applications

Social competence

- Students can work in small groups to jointly solve technical problems, and experimentally validate them
- Students jointly develop ideas and deal creatively with questions in working groups
- The student can reflect their knowledge and discuss and evaluate their own results

Autonomy

- Analytical thinking and attention to details
- Ability to consider different strategies to solve problems

Applicability in this and other Programs

- HSB-11 Standards and Legal Framework
- HSB-16 R&D Project
- HSB-17 Master Thesis

Entrance Requirements

None
Learning Content

The module provides introduction to fundamentals of environmental analytical methods of measurement and analysis of indoor and building related factors focusing on:

- Measurement parameters, unit systems, standards
- Signals, characterization, conversion
- Measuring methods and devices, basic instruments
- Evaluation of measurement results, errors and uncertainties
- Measurement of electrical quantities and non-electrical physical quantities
- Measurement of indoor environmental factors and their harmful components
- Monitoring, Sampling and Analysis
- Physical factors: fields, waves, radiation
- Chemical factors: gases, volatile organic compounds and chemicals
- Biological factors: bioaerosols, fungi, bacteria
- Dust and Particulates
- Continuous monitoring, sensors and detectors, sensitivity and selectivity
- Sampling approaches and methods
- Analytical methods: physical and chemical analysis, bioassays
- Principles of gas and liquid chromatography
- Spectroscopy methods: ultraviolet, visible, infrared and Raman spectroscopy
- Analytical voltammetry and polarography
- Fluorescence: UV and X-Ray spectrometry
- Microscopy
- Bioassays and Techniques for DNA Analysis
- Standards and exposure limits
Teaching Methods

Lectures / exercises / tutorials / homework / Lab work

PowerPoint presentation, whiteboard, document camera (visualizer) and additional lecture materials in iLearn

Students work individually and in groups on practical examples on measuring environmental factors, their analysis and representation of results employing scientific graphing and data analysis tools.

### Module Objective

Students learn the concept of Evidence-based Design in the area of residential and school buildings and are able to use the newly acquired knowledge to develop projects with this specific focus.

#### Professional competence

**Knowledge**

After successfully finishing the module, students will get to:

- Understand the concepts of Evidence-based Design
- Know where and how to find latest relevant knowledge, including research results, in the area of Evidence-based Design for residential buildings and schools.
- Understand the connection between design decisions, health, productivity and investment costs
- Know the process of life-cycle-analysis
Understanding the role of different stakeholders in the planning process of sustainable buildings

**Skills**

Upon completion of the module, the students will be able to:

- Analyse the specific needs of the client
- Analyse the necessary fields of competence and decide which further experts have to be invited to the design team
- Organize relevant information concerning specific building type design concepts, regulations and recommendations
- Apply relevant knowledge in the design of residential and school buildings
- Evaluate different design options concerning health, productivity and investment costs, as well as operation & maintenance costs

**Social competence**

Students are demonstrating working individually or in small groups to solve problems that aim at enhancing their team-working skills as well as their problem-solving capabilities. Presenting their project, they learn how to address clients and enhance their social communication skills. Students analyse, understand and address stakeholder adequately.

**Methodological competence**

The students improve their knowledge in the field of Evidence-based Design in the area of residential buildings and schools and are able to evaluate different design options. With the newly acquired knowledge, they are able to pre-select design solutions, taking into consideration the effects on tenant’s health, productivity and well-being.

Furthermore, the students are able to evaluate and decide upon preliminary solutions concerning investment costs, as well as operation & maintenance costs.

**Applicability in this and other Programs**

- HSB-11 Standards and Legal framework
- HSB-13 Evidence-based Design 2
- HSB-14 Refurbishment, Renovation
- HSB-16 R&D Project
- HSB-17 Master’s Thesis
Entrance Requirements

Recommended:

HSB-02 Sustainable Buildings
HSB-03 Smart Buildings

Learning Content

- Introduction into Evidence-based Design
- Different aspects of Evidence-based Design concerning residential buildings and schools, considering different climate zones
- Life-cycle-analysis
- Life-cycle-cost-analysis
- Economic consequences of Evidence-based Design
- Building Certification Systems for Healthy buildings - selected criteria
- Planning of a school building under specific conditions of the students’ region of origin

Teaching Methods

Seminaristic teaching / Design Project / tutorials / homework / Case studies

Remarks

Excursions to companies and/or landmark projects

Recommended Literature

Different buildings types

Residential buildings

School buildings

- USGBC (2019) LEED BD+C: Schools.v4. USA: USGBC
**Module Objective**

Societies are ageing and new technologies can improve the quality of living of elderly people and person with special needs. Furthermore, adequate assistance systems and architectural planning can reduce the costs of the health sector.

Students learn the concept of Ambient Assisted Living and are able to use the newly acquired knowledge to develop projects with this specific focus.

**Professional competence**

**Knowledge**

After successfully finishing the module, students will get to:

- Understand the basic concepts of Ambient Assisted Living
- Understand the limitations through age by having used the age-simulation suit and a wheelchair in different situations
- Understand innovative design concepts for modern work environments to foster health and productivity.
Skills

Upon completion of the module the students will be able to:

- Analyse the specific needs of the target group
- Evaluate different technologies and design concepts
- Implement passive and active concepts and solutions accordingly in order to reduce or even overcome the problems caused by analysed and synthesized limitations.
- Apply relevant knowledge in the design of different buildings types, like residential buildings, schools, health buildings and tourism buildings.
- Evaluate economic, social and environmental benefits of Ambient Assisted Living.
- Apply relevant criteria demanded by GB and HB certification systems.

Social competence

Students are gaining awareness of limitations imposed by age or accident. They can address with empathy these limitations. The project work can optionally be carried out in cooperation with students from Master International Tourism Development and Master Medical Informatics.

Methodological competence

The students improve their knowledge in the field of Ambient Assisted Living and are able to evaluate and different design option, proposing the most adequate one. With the newly acquired knowledge they are able to pre-select design solutions, taking into consideration the effects on tenant’s health, productivity and well-being. Using an age-simulating-suit and a wheelchair, they experience first-hand the challenges a significant part of population is facing.

Furthermore, the students are able to evaluate and decide upon preliminary solutions concerning investment costs, as well as operation & maintenance costs.
Applicability in this and other Programs

- HSB-11 Standards and Legal Framework
- HSB-13 Evidence-based Design 2
- HSB-14 Refurbishment, Renovation
- HSB-16 R&D Project
- HSB-17 Master’s Thesis

Entrance Requirements

Recommended:

HSB-02 Sustainable Buildings
HSB-03 Smart Buildings

Learning Content

- Introduction into Ambient Assisted Living – the origins, current situation and tendencies
- Limitations through age or accidents/disabilities – experience with an Age-simulation suit & a wheelchair
- Passive and active measures of Ambient Assisted Living
- Concept development for different building types
- Building Certification Systems for Healthy buildings – focus on Ambient assisted Living
- Planning of a residential building using Ambient Assisted Living concepts

Teaching Methods

Seminaristic teaching / Design Project (residential) / tutorials / homework / Case studies / Age-simulation-suit / Wheelchair
Remarks

- Use of age-simulation suit
- Use of wheelchair
- Excursions to companies and/or landmark projects

Recommended Literature

### Module Objective

Students learn the concept of building safety and security and are able to use the newly acquired knowledge to develop projects with this specific focus.

**Professional competence**

**Knowledge**

After successfully finishing the module, students will get to:

- Understand the basic concepts of Building Safety and Security
- Know where and how to find latest relevant knowledge, including research results, in the area of Evidence-based Design for health and tourism buildings.
- Understand the connection between design decisions, health, productivity and investment costs in the focus area.
Skills

Upon completion of the module the students will be able to:

- Analyse and formulate the specific needs of client
- Develop tailor-made solutions for different groups of clients
- Apply relevant knowledge in the planning of new buildings and neighbourhoods
- Use relevant knowledge in the planning of refurbishment and renovation
- Apply relevant knowledge during the construction phase
- Use relevant knowledge during operation and maintenance of the building
- Evaluate different options concerning safety, security, health, productivity and investment costs, as well as operation & maintenance costs in the focus area

Social competence

Students are demonstrating working individually or in small groups to solve problems that aims at enhancing their team-working skills as well as their problem-solving capabilities. Further, these groups are lined-up in a way to be mixed multi-cultural in order to foster and fine-tune students’ intercultural interaction capabilities.

Methodological competence

The students improve their knowledge in the field of Building safety and security and are able to analyse specific demands and evaluate different design options for specific climatic conditions. With the newly acquired knowledge they are able to pre-select design solutions, taking into consideration the effects on tenant’s safety, security, health, productivity and well-being.

Furthermore, the students are able to evaluate and decide upon preliminary solutions concerning investment costs, as well as operation & maintenance costs.

Applicability in this and other Programs

HSB-11 Standards and Legal Framework
HSB-13 Evidence-based Design 2
HSB-14 Refurbishment, Renovation
HSB-16 R&D Project
HSB-17 Master’s Thesis
Entrance Requirements
None

Learning Content
Introduction into Building Safety and Security

Building Safety
- Fire Safety and Explosion
- Escape Plan and Rescue Routes
- Electrical and Mechanical faults (Power Failure, Elevator Failure)
- Smoke and Heat Extraction systems
- Plumbing Failure and Flooding
- Earthquake
- Special topic: reactor safety – how to keep a reactor safer in an advanced building (vessel)

Work safety
- Work safety: introduction, history, Laws and by-laws in Germany
- Hazardous substances and corresponding symbols
- Exposition scenarios, particulate matter and micro-bacterial exposure
- Radiations and Vibrations
- Risk assessment

Building Security
- Building Security Concepts and Systems
- Special topic: Fire Protection

Teaching Methods
Seminaristic teaching / Project Design / tutorials / homework / Case studies

Remarks
Excursion
Recommended Literature

- Deutsche Gesetzliche Unfallversicherung e.V. (2012) *Machine Tool Fire and Explosion Prevention and Protection* (Information book in English)
Module Objective

Students will learn about the processes involved in project management and implementation in international settings. Beginning with the process of building and leading international project team, to project management theory and steps, to finally looking at the implementation of successful project management, this course aims to provide a complete picture of international project management in practice. Additionally, different types of project management will be compared, so that the students will be able to apply the most effective method, based on the type of project and/or team that they are dealing with.

Professional competence

Knowledge

After successfully finishing the module, students should:

- Understand project management theory and its application
- Understand all the steps involved in project management
- Understand the different roles involved with project management
Understand how project management teams work together or are put together in different international environments

Understand how to choose the correct type of project management method for different types of projects

Understand the different steps in project management and show these on a theoretical in class project

Understand the challenges and typical project “fails” in implementation of project management

Understand how effective project management leadership works in different international environments

**Skills**

Upon completion of the module the students will be able to:

- Transfer theoretical knowledge of project management real world projects
- Determine which project management method is most effective in different situations
- Manage a project and put together an international team to oversee and implement the project effectively
- Recognize the signs when a project is not working or failing
- Work on different projects in various international environments

**Social competence**

Students will work together on an in-class projects in small groups, in order to learn how to work efficiently with each other on solve problems and on implementing their knowledge together. This aims at enhancing their team-working skills as well as their problem-solving capabilities. Further, these groups are lined-up in a way to be mixed multi-cultural in order to foster and fine-tune students’ intercultural interaction capabilities.

**Methodological competence**

The students will learn how to transfer theoretical knowledge into a project, and hence, will be able to apply their learned skills. This leads to greater retention of the learned theory, and enables transference skills. Further, the students will be provided with an overview of different sets of skills and theory, and will be able to choose the most efficient approach to applying these. Students will develop an analytical system-oriented way of thinking and should able to structure the most effective approach to international project management from different aspects, beginning with planning, selection, to implementation.
Applicability in this and other Programs

- HSB-13 Evidence-based Design 2
- HSB-14 Refurbishment, Renovation

Entrance Requirements

none

Learning Content

- Project management theories
- Project roles and stakeholders
- Project management theories
- Project roles and stakeholders
- Project management steps
- Project management in international environments – cultural differences
- Project management leadership
- Project management teams
- Project management implementation in international environments
- Project management fails

Teaching Methods

Interactive lecture, case studies, in-class project, group work, discussions and presentations of work in progress.
Recommended Literature

Module Objective

Students learn national and international building standards relevant to sustainable and healthy buildings.

Students learn the concept of Building Certification Systems for different building types and neighbourhoods. Furthermore, the students are introduced into the application process and train on selected credits the concrete application.

Professional competence

Knowledge

After successfully finishing the module, students will get to:

- Understand the organization of international, national and regional standards
- Know the most relevant standards for sustainable and healthy buildings
- Understand the concept and approach of Green Building Certification systems
- Understand the concept and approach of Healthy Building Certification systems
o Know most relevant certification systems in the area of sustainable and healthy buildings

o Know where and how to find latest relevant knowledge, including research results, in the area of Green Building and Healthy Building Certification systems

**Skills**

Upon completion of the module the students will be able to:

o Explain the applicability of international, national and regional standards and their importance for sustainable and healthy buildings

o Explain concept, approach and benefits of different certification systems

o Select the most adequate certification system

o Organize workgroups and workflow for certifications

o Prepare documentation for the certification process

**Social competence**

Students are demonstrating working individually or in small groups to solve problems that aims at enhancing their team-working skills as well as their problem-solving capabilities. Further, these groups are lined-up in a way to be mixed multi-cultural in order to foster and fine-tune students’ intercultural interaction capabilities. They communicate adequately with different stakeholder and experts.

**Methodological competence**

The students improve their knowledge in the field of Green Building and Healthy Building certification systems and are able to organize workgroups and workflow for the certification. With the newly acquired knowledge they are able to select the most adequate systems and organize and prepare the necessary documentation for certification processes.

**Applicability in this and other Programs**

o HSB-13 Evidence-based Design 2

o HSB-14 Refurbishment, Renovation

o HSB-16 R&D Project

o HSB-17 Master’s Thesis
Entrance Requirements

Recommended:

HSB-02 Sustainable Buildings

HSB-03 Smart Buildings

Learning Content

- Standards – internationally, nationally and regionally – an introduction
- PassivHaus Standard, KfW standards
- Most relevant standards for sustainable and healthy buildings
- Standards and their importance for Certification systems
- Introduction into different Green Building Certification Systems – concept, structure and approach
- Introduction into different Healthy Building Certification Systems – concept, structure and approach
- Analysis of most relevant criteria
- Economic aspects of certification systems
- Certification process as teamwork: how to organize workgroup and workflow
- Applicability of certification systems in different countries and climate zones

Teaching Methods

Seminaristic teaching / Exercises / tutorials / homework / Case studies

**Module Objective**

Building Performance Simulations are an important tool for the design of sustainable and healthy buildings.

Students learn the concept of Building Performance Simulations for different areas and are able to apply this knowledge in practice.

**Professional competence**

**Knowledge**

After successfully finishing the module, students will get to:

- Understand the concepts Building Performance Simulations, taking into consideration different climate zones
- Know where and how to find latest relevant knowledge, including research results, in the area of Building Performance Simulations.
- Understand the connection between design decisions, health, productivity and investment costs in the focus area.
Skills

Upon completion of the module the students will be able to:

- Perform parameter studies for different areas, focusing and energy efficiency and Indoor Environmental Quality parameter
- Use building performance simulation tools to optimize building layout
- Apply building performance simulation tools to optimize selection of systems and materials
- Use building performance simulation tools to calculate cost-benefit relation for different solutions
- Prepare climate data for projects worldwide

Social competence

Students are demonstrating competence working individually or in small groups to solve problems that aims at enhancing their team-working skills as well as their problem-solving capabilities. Further, these groups are lined-up in a way to be mixed multi-cultural in order to foster and fine-tune students’ intercultural interaction capabilities.

Methodological competence

The students improve their knowledge in the field of Building Performance Simulations for different building types and are able to evaluate different design options for specific climatic conditions. With the newly acquired knowledge they are able to improve design solutions, taking into consideration the effects on tenant’s health, productivity and well-being.

Furthermore, the students are able to evaluate and improve solutions concerning investment costs, as well as operation & maintenance costs.

Applicability in this and other Programs

- HSB-11 Standards and Legal framework
- HSB-13 Evidence-based Design 2
- HSB-14 Refurbishment, Renovation
- HSB-16 R&D Project
- HSB-17 Master’s Thesis
Entrance Requirements

Recommended:

HSB-02 Sustainable Buildings
HSB-03 Smart Buildings

Learning Content

- Introduction into Building Performance Simulations
- Concept and structure of Parameter studies
- Building Performance Simulations: Thermal & visual comfort, energy consumption
- Building Performance Simulation: Acoustic comfort
- Building Performance Simulation: Moisture check
- Solar Energy Systems Performance
- Climate data bank usage
- Building Performance Simulation and Green Building Certification Systems

Teaching Methods

Seminaristic teaching / Exercises - IT lab / tutorials / homework / Case studies

Recommended Literature

Software tutorials
Module Objective

Students learn the concept of Evidence-based Design in the area of health, tourism and office buildings and are able to use the newly acquired knowledge to develop projects with this specific focus.

Professional competence

Knowledge

After successfully finishing the module, students will get to:

- Understand the concepts of Evidence-based Design
- Know where and how to find latest relevant knowledge, including research results, in the area of Evidence-based Design for health buildings and tourism buildings.
- Understand the connection between design decisions, health, productivity and investment costs
- Understand the role of different stakeholders in the planning process of sustainable buildings
Skills

Upon completion of the module the students will be able to:

- Analyse the specific needs of the client
- Analyse the necessary fields of competence and decide which further experts have to be invited to the design team
- Organize relevant information concerning specific building type design concepts, regulations and recommendations
- Apply relevant knowledge in the design of health, tourism and office buildings
- Evaluate different design options concerning health, productivity and investment costs, as well as operation & maintenance costs

Social competence

Students are demonstrating working individually or in small groups to solve problems that aims at enhancing their team-working skills as well as their problem-solving capabilities. Presenting their project, they learn how to address clients and enhance their social communication skills.

Methodological competence

Students are demonstrating working individually or in small groups to solve problems that aims at enhancing their team-working skills as well as their problem-solving capabilities. Further, these groups are lined-up in a way to be mixed multi-cultural in order to foster and fine-tune students’ intercultural interaction capabilities. The project work can optionally be carried out in cooperation with students from Master International Tourism Development.

Applicability in this and other Programs

- HSB-16 R&D Project
- HSB-17 Master’s Thesis

Entrance Requirements

Recommended:

HSB-02 Sustainable Buildings
HSB-03 Smart Buildings
HSB-07 Evidence-based Design 1
Learning Content

- Introduction into Evidence-based Design
- Different aspects of Evidence-based Design concerning health, tourism and office buildings, considering different climate zones
- Economic consequences of Evidence-based Design
- Building Certification Systems - selected credits
- Designing a health or tourism building for a region with a different climate to the one in the students’ region of origin

Teaching Methods

Seminaristic teaching / Exercises / Design Project / tutorials / homework / Case studies

Recommended Literature

Different building types

Health buildings

Certifications systems

- USGBC (2019) LEED BD+C: Healthcare
- USGBC (2019) LEED BD+C: Hospitality
- USGBC (2019) LEED BD+C: New Construction
### Module Objective

Most buildings already exist – in Germany only around 1% of the building stock consists of new buildings of the same year. Furthermore, most older buildings do not comply with current comfort standards, energy regulations and are often far away from sustainability. Therefore, refurbishment and renovation are a major field of activities in the area of healthy and sustainable buildings.

Students learn the concept of Refurbishment and Renovation for different areas and climate zones and are able to apply this knowledge in practice.

#### Professional competence

**Knowledge**

After successfully finishing the module, students will get to:

- Understand the concepts of sustainable and healthy Refurbishment and Renovation, taking into consideration different climate zones and regional, national and international building materials

- Know where and how to find latest relevant knowledge, including research results, in the area of Refurbishment and Renovation.
o Understand the connection between design decisions, health, productivity and investment costs in the focus area.

o Know of GB and HB certification systems with focus on refurbishment and renovation

Skills

Upon completion of the module the students will be able to:

o Analyse and structure the needs of clients

o Analyse and define the adequate team composition with necessary experts

o Communicate adequately with experts of fields of related knowledge

o Structure Refurbishment and Renovation projects, considering all relevant aspects of sustainability and health in buildings and neighbourhoods

o Follow the guidelines of selected building certification systems for sustainable and healthy refurbishment and renovation and prepare the documentation of select credits

o Develop sustainable and healthy refurbishment and renovation projects

Social competence

Students are demonstrating competence working individually or in small groups to solve problems that aims at enhancing their team-working skills as well as their problem-solving capabilities. Further, these groups are lined-up in a way to be mixed multi-cultural in order to foster and fine-tune students’ intercultural interaction capabilities.

Methodological competence

The students improve their knowledge in the field of refurbishment and renovation for different building types and are able to evaluate different design options for specific climatic conditions. With the newly acquired knowledge they are able to improve design solutions, taking into consideration the effects on tenant’s health, productivity and well-being.

Furthermore, the students are able to evaluate and improve solutions concerning investment costs, as well as operation & maintenance costs.

- USGBC (2019) *LEED BD+C: Retail*. USA:USGBC
Module Objective

Sustainable and smart building systems, with focus on sustainable energy supply systems for buildings, as well as Smart Infrastructure is an important and novel concept to reduce resource consumption, while maintaining or even improving the quality of living. Artificial intelligence and/or machine learning is starting to change our world – it can be a powerful tool to foster sustainability. Students learn the concept of sustainable energy supply systems for buildings, Smart Infrastructure and Artificial Intelligence and are able to use the newly acquired knowledge in the development of projects with this specific focus.

Professional competence

Knowledge

After successfully finishing the module, students will get to:

- Understand the basic concepts of Smart Building Systems, with focus on sustainable energy supply systems for buildings, Smart Infrastructure and Artificial Intelligence.
Understand the potential and challenges of Smart building Systems, Smart Infrastructure and Artificial Intelligence.

Know where and how to find latest relevant knowledge, including research results.

Understand the connection between design decisions concerning Smart Building Systems, Smart Infrastructure and Artificial Intelligence, health, productivity and investment costs in building and neighbourhood projects.

**Skills**

Upon completion of the module the students will be able to:

- Analyse the potential of using Smart Building Systems, with focus on sustainable energy supply systems, Smart Infrastructure in building and neighborhood projects and communicate efficiently with further building and urban planning experts.

- Analyse the potential of using Artificial Intelligence in building and neighbourhood projects and communicate efficiently with further building and urban planning experts.

- Evaluate different options of using Smart Infrastructure and AI concerning health, productivity and investment costs, as well as operation & maintenance costs in buildings and neighbourhoods.

- Develop design concepts integrating Smart Infrastructure concepts.

**Social competence**

Students are demonstrating working individually or in small groups to solve problems that aims at enhancing their team-working skills as well as their problem-solving capabilities. Further, these groups are lined-up in a way to be mixed multi-cultural in order to foster and fine-tune students’ intercultural interaction capabilities.

**Methodological competence**

The students improve their knowledge in the field of Smart Building Systems, Smart Infrastructure and Artificial Intelligence and are able to evaluate different options for specific climatic and socio-economic conditions. With the newly acquired knowledge they are able to pre-select concepts, taking into consideration the effects on tenant’s health, productivity and well-being.

Furthermore, the students are able to evaluate and decide upon preliminary solutions concerning investment costs, as well as operation & maintenance costs.

**Module Objective**

The students have a solid understanding of Research and Development as part of the innovation process in the building sector.

The objective of this module is to create the connection of research relevant content of module HSB-4 "Advanced Quantitative and Qualitative Research Methods" with "Development", specifically the innovation processes in the building industry. The innovation process itself includes strategy, technology management, road mapping, idea generation and selection, creation of business cases, product development process, market launch, product maintenance, project management and agile methods.

**Professional competence**

*Knowledge*

After successfully finishing the module, students will get to:

1. Understand methods of all mentioned fields of the innovation process independently
2. Understand in how to design the innovation process in all of the above-mentioned aspects
**Skills**

Upon completion of the module the students will be able to:

- Apply methods of all mentioned fields of the innovation process independently and transfer them to new problem areas
- Design the innovation process in all of the above-mentioned aspects and to adapt it to the requirements of the company

**Social competence**

- Students are demonstrating working individually or in small groups to solve problems that aims at enhancing their team-working skills as well as their problem-solving capabilities. Further, these groups are lined-up in a way to be mixed multi-cultural in order to foster and fine-tune students’ intercultural interaction capabilities. The project work can eventually be carried out in cooperation with students from Bachelor Industrial Engineering.

**Methodological competence**

The students improve their knowledge in the field of Research and Development in the building sector and are able to set up, organize and carry out small R&D projects. With the newly acquired knowledge they are able to communicate efficiently with R&D specialists of different areas of engineering and social sciences.

**Applicability in this and other Programs**

HSB-17 Master's Thesis

**Entrance Requirements**

Recommended:

- HSB-01 Environmental Psychology
- HSB-02 Sustainable Buildings
- HSB-03 Smart Buildings
- HSB-04 Advanced Quantitative and Qualitative Research Methods
- HSB-05 Environmental Hygiene and Medicine
- HSB-07 Evidence-based Design 1
- HSB-11 Standards and Legal framework
**Learning Content**

- Strategy process, Vision, Mission, Hoshin Kanri
- Product portfolios
- Road mapping, integrated Roadmaps
- Creativity techniques
- Idea management, Evaluation systems
- Product development process, V-Model
- Agile development methods, SCRUM
- Lean Management with focus on Research & Development (R&E)
- Project management
- Organisation structures, Organisation of R&D setup
- Product management
- Development and presentation of Business plans

**Teaching Methods**

Seminaristic teaching / group work / homework / Case studies

Script
Module Objective

The master's thesis is intended to enable independent scientific work in a subject in architecture, civil or environmental engineering, with focus and HSB. The accompanying presentation should promote the ability to appropriately work up and present technical topics in an understandable manner. The master's thesis is intended to determine whether the students have acquired the thorough specialist knowledge necessary for the transition to work, have an overview of the interrelationship between the subject and have the ability to work on problems in the in-depth subject area with scientific methods and to apply scientific knowledge.

The master's thesis is intended to show that the candidate is capable of independently completing a practical task in its technical details as well as in interdisciplinary contexts according to scientific and practical aspects within a specified period.

The approximately 30-minute colloquium (presentation and questioning) serves to determine whether the candidate is able to verbally present the essential basics, relationships and results of the master's thesis, to justify independently and to assess their importance for practice; the use of presentation aids is expressly encouraged.

- Applications of scientific methods
- Scientific documentation
- Interdisciplinary work
- Interface competence
